MariaDB Enterprise
Notification Service

Will the next release boost your performance?
Fix that irritating issue?
The MariaDB Enterprise Notification Service brings you information on
upcoming releases and security notices, *tailored to your needs*.

Notifications You Can Use

Tired of reading detailed change logs and doing manual research on how a release will affect you? Let the new MariaDB Enterprise Notification Service figure it out, and give you an easy to understand report instead.

An exclusive benefit of MariaDB Enterprise, the Notification service uses detailed data on your versions and how you use the database to filter change logs, and send you timely notices of releases which highlight what is new that will affect your deployment.
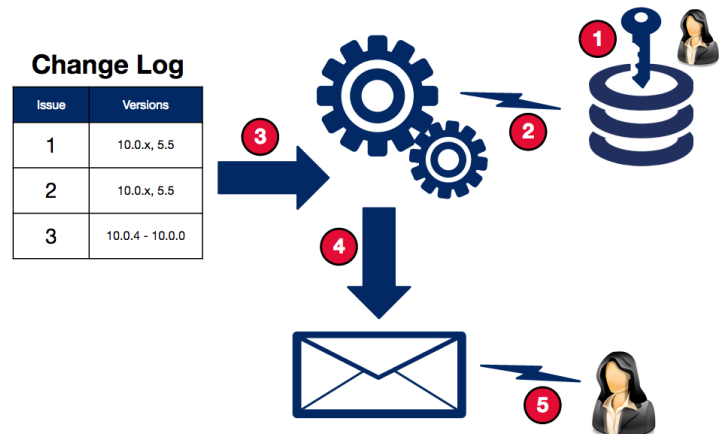

Timely and Relevant

A few weeks before a release, you'll receive a customized email with specifics on the new features and fixes that are relevant to you. An agent running on your servers analyzes your installed versions, options, and usage. The service then crafts a customized notice based on your configuration. Of course, you'll be notified immediately if there is a critical security bulletin that applies to you - complete with recommended mitigation.

Part of a Comprehensive Package

MariaDB Enterprise is a yearly subscription to a complete set of curated binaries, tools, services, and know-how - everything you need to use the industry-leading MariaDB open source RDBMS in the most challenging applications. Find out how we can cost-effectively help you gain the scalability, availability and agility you need from your data infrastructure - contact us today!

Notification Service

Change Log

Issue	Versions
1	10.0.x, 5.5
2	10.0.x, 5.5
3	10.0.4 - 10.0.0

How It Works:

1. Using the unlocking code you receive, activate the feedback agent on each of your servers.

2. The feedback agent evaluates your configuration, and sends this data back to MariaDB Corp. Or send the agent's report to us yourself, if your servers aren't on the Internet.

3. The Notification Service processes change logs for new versions and security issues.

4. It then matches your unique configuration with the change logs to create a customized notice of specific changes that apply to you.

5. This notice then is emailed directly to you - tailored understanding of upcoming releases and critical issues.
